CYCOSINE DASPIALE.

CYCOSINE DASPIALE.

CYCOSINE DASPIALE.

C' SUBUNIT: LIGATION OF CD2, TCR OR CD28 INDUCES ACTIVATION AND TYROSINE HOSPHORYLATION OF ITK.

C' SUBCELLULAR LOCATION: LOCALIZES TO CELL SURFACE RECEPTORS IN THE PLASMA MEMBRANE AFTER STIMULATION WITH RESPECTIVE RECEPTORS (TCR, CD28, CD2) IN T-CELLS.

C' TISSUE SPECIFICITY: IS DETECTED IN THE THYMUS, LYMPH NODE AND VERY FAINTLY IN THE SPLEEN, BUT IS NOT DETECTED IN THE LIVER, LUNG, LYMPHOCYTES AND WAST CELLS. IT MAY ALSO BE EXPRESSED IN T-LYMPHOCYTES AND WAST CELLS. IT MAY ALSO BE EXPRESSED IN THE MATURAL STAGE: IS PRESENT IN THE FETAL THYMUS AS EARLY AS THYMOCYTES THAN IN PERIPHERAL T CELLS, AND INCREASE IN THE THYMUS AS LIVER THYMOCYTES THAN IN PERIPHERAL T CELLS, AND INCREASE IN THE THYMUS DEVELOPMENT FROM MECONATE TO ADULT.

C' INDUSPENSIBLE FOR THE ACTIVATION THROUGH TCR/CD3.

C' DOMAIN: THE PH DOMAIN MEDIATES TARGETING OF ITK/TSK AND IS SUBFAMILY.

C' SIMILARITY: CONTAINS 1 SH3 DOMAIN.

SIMILARITY: CONTAINS 1 SH3 DOMAIN.

 BC006665 3107 bp mRNA linear ROD 07-AUG-2002 Mus musculus, clone MGC:5989 IMAGE:3499247, mRNA, complete cds.
 found
 Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,
Mammalia, Eutheria, Rodentia, Sciurognathi, Muridae, Murinae, Mus.
 Clone distribution: MGC clone distribution information can be four through the I.M.A.G.B. Consortium/LIANL at: http://image.llnl.gov Series: IRAK Plate: 9 Row: h Column: 9
This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis, GenomeScan gene prediction, Similarity but not identity
 Direct Submission
Submitted (27-APR-2001) National Institutes of Health, Mammalian

 Submitted (08-MAR-2002) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA (bases 1 to 135147)
 Center: Whitehead Institute/ MIT Center for Genome Research
 NOTE: This is a 'working draft' sequence. It currently consists of 5 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.
 Insert size: 151000; agarose-fp
Insert size: 134747; sum-of-contigs
Quality coverage: 11.0 in Q20 bases; sum-of-contigs
Quality coverage: 12.3 in Q20 bases; sum-of-contigs
 All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-1997)

 Sequence Summired by:

Berkeley Drosophila Genome Project
Lawrence Berkeley National Laboratory
Berkeley Drosophila Genome Project
Lawrence Berkeley National Laboratory
Berkeley CA 94720

This clone was sequenced as part of a high-throughput process to
Science 2000). The sequence has been subjected to integrity checks
for sequence accuracy, presence of a polyA tail and contiguity
within 100 kb in the genome. Thus we believe the sequence to
reflect accurachly this particular cDMA clone. However, there are
artifacts associated with the generation of CDNA clones that may
have not been detected in our initial analyses such as internal
priming, priming from contaminating genomic DNA, retained introns
due to reverse transcription of unspliced precursor RNAs, and
reverse transcriptions that result in single base changes.
For further information about this sequence, including its location
and relationship to other sequences, please visit our Web site
(http://fruitfly.berkeley.edu) or send email to
Nunoo,J., Pacleb,J., Paragas,V., Park,S., Phouanenavong,S., Wan,K., Yu,C., Lewis,S.E., Rubin,G.M. and Celniker,S.

 The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function(s) of TGF-beta activated kinase I (TAKI). The NFkB activation inhibitors targeting on TAKI can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The present sequence represents the nucleotide sequence of human TAKIC

 A method has been developed for screening for substances which inhibit the binding of TAK1 polypeptide to TAB1 polypeptide. The method comprises: (a) contacting the polypeptide in the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample can be pre-mixed with TAK1 or TAB1 polypeptide first. The transforming growth factor (TGF) beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmisson inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or cell proliferation prevention inhibitors o activators, or monopyte migration inhibitors or activators, or monopyte migration inhibitors or activators, or

 TAK-1
 The present sequence encodes human transforming growth factor-beta (TGF-beta) activated kinase, TAK-1. The DNA is used to produce the TAK-1 protein which is involved in the TGF-beta family signal transmission system. TAK-1, also known as activator of MAPK Kinase (AMK-1), is an enzyme which is activated by TGF-beta and bone morphogenetic protein (BMP) and activates MAPK kinase by

 A method has been developed for screening for substances which inhibit the binding of TAKI polypeptide to TABI polypeptide. The method comprises: (a) contacting the polypeptide in the presence of a sample, and (b) decreting the amount of bound polypeptide, in which the sample can be pre-mixed with TAKI or TABI polypeptide first. The transforming growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or cell proliferation prevention inhibitors or activators, or monocyte migration inhibitors or activators, or activators, or activators in minibitors or activators.
 physiological activity induction inhibitors or activators, or immunosuppression inhibitors or activators, or amyloid beta protein precipitation inhibitors or activators, and such substances can also be inhibitors of the TAXI polypeptide function, particularly kinase activity. The present sequence encodes human TAXI.

 inhibition of inflammatory cytokine signal transduction by contacting the sample with TAK1 and its receptor TAB1 and selecting for inhibition of TAK1/TAB1 binding. Also described is a method for screening compounds for inhibition of inflammatory cytokine signal transduction in which the inhibition of TAK1 phosphorylation is selected for; and drug compositions for the treatment of inflammatory disorders containing as active component an inflammatory cytokine signal transduction inhibitor. TAK1 is an essential component of the signalling process which results in release of inflammatory cytokine signal transduction inhibitor. TAK1 is an essential component of the signalling process which results in release of inflammatory cytokines such as interleukin-1 (IL-1), IL-10, tumour necrosis factor (TMF) and IL-6. The methods can be used for the selection of effective antiinflammatory agents. The present sequence encodes human TAK-1, which is used in the exemplification of the

 RESULT
 The invention relates to identifying pain-regulating substances (A) comprises (i) incubating a test substance with a cell (or preparation from it) that has synthesised a peptide or protein (B) and (ii) measuring either binding of the test substance to (B) or some functional parameter that is altered by this binding. The method is useful for identifying pain-regulating substances (A) with analyssic activity. (A) along with nucleic acid (ABL88411-ABL88441) that encode proteins (B), ABB85006-ABB85037) that interact with (A); (B); vectors containing the nucleic acid; antibodies against (B); cells that express (B) and agents that bind to (B), are all useful for treating pain, particularly chronic pain, including use in gene therapy. The same materials can also be used for diagnosis, e.g. of neurological and neurodegenerative diseases. The present sequence is that of a polynucleotide of the invention.
 Identifying pain-regulating and for diagnosis, by measur peptides and proteins -

 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention isseful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, cosophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear call cancer infiltrating ductal cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell cancer on percendentine

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 transforming growth factor-beta receptor signal transduction pathway, which activates TAK-1 kinase activity upon binding. Its amino acid sequence was deduced from a CDNA clone (see AAT91175) obtained from a kidney library; a variant TABB1 (see AAW26707) has arg rather than Ser at amino acid position 52. Also claimed are: isolated DNA encoding a protein modified by a substitution, deletion and/or addition of 1 or more amino acids of the 504-residue TAB1 sequence; (2) DNA which can hybridise with the 1560 by TAB1 nucleic acid sequence; (3) isolated DNA encoding a protein comprising amino acids 21-579 or 437-504 of the 504 TAB1 sequence;
 (4) DNA encoding a fusion protein comprising an above protein or polypeptide; (5) expression vector comprising an above DNA; and (6) host cell, preferably a mammalian or yeast cell, transformed by the expression vector. Cells expressing TAB1 and TAK1 can be used to screen for TGF-beta signalling pathway inhibitors by contacting the cells with a test compound, and measuring the TAK1 kinase
 DNA encoding TAK1 binding protein TAB1 - member of transforming growth factor beta receptor signal production pathway, which activates TAK-1 kinase activity upon binding

 A method has been developed for screening for substances which inhibit the binding of TAKI polypeptide to TABI polypeptide. The method comprises: (a) contacting the polypeptide in the presence of a sample, and (b) detecting the amount of bound polypeptide, in which the sample can be pre-mixed with TAKI or TABI polypeptide first. The transforming growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or cell proliferation prevention inhibitors cactivators, or monocyte migration inhibitors or activators, or inhibitors or activators, or inhibitors or activators, or monocyte migration inhibitors or activators, or
 physiological activity induction inhibitors or activators, or immunosuppression inhibitors or activators, or amyloid beta protein precipitation inhibitors or activators, and such substances can also inhibitors of the TAK1 polypeptide function, particularly kinase
 Screening for TGF- beta inhibitory substances, which are useful drugs for treatment of diseases relating to its disorder % \left(1\right) =\left\{ 1\right\}

 The present invention describes a method for screening compounds for the sample with TaKI and its receptor TABI and selecting for inhibition of inflammatory cytokine signal transduction by contacting the sample with TaKI and its receptor TABI and selecting for inhibition of TAKI/TABI binding. Also described is a method for screening compounds for inhibition of TAKI phosphorylation is selected for; and drug compositions for the treatment of inflammatory disorders containing as active component an inflammatory cytokine signal transduction inhibitor. TAKI is an essential component of the signalling process which results in release of inflammatory cytokine such as interleukin-I (III-I), for the selection of effective antiinflammatory agents. The present for the selection of effective antiinflammatory agents. The present the represents human TABI, which is used in the exemplification of

 The invention relates to a method for screening a substance inhibiting the formation of a complex between XIAP and TAB1, in which X-linked inhibitor of apoptosis protein (XIAP). Itransforming growth factor-beta activated kinase I(TAK1) binding protein I(TAB1) and a substance to be tested are contacted with each other and then the presence or formation of a complex between XIAP and TAB1 is detected. The substance can be used as a drug for extracellular matrix protein production enhancement, cell growth inhibition, monocyte migration, physiologically active substance induction, immunosuppression, and beta analyloid protein deposition. A substance inhibiting the formation of a complex between TAB1 and XIAP as well as between XIAP and TGF-beta (Transforming growth factor-beta) type

A method has been developed for screening for substances which inhibit to the binding of TARI polypeptide to TARI polypeptide. The method comprises: (a) contacting the polypeptide in the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample can be pre-mixed with TARI or TARI polypeptide first. The transforming growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or cell proliferation prevention inhibitors or activators, or monocyte migration inhibitors or activators, or physiological activity induction inhibitors or activators, or immunosuppression inhibitors or activators, or anyloid beta protein precipitation inhibitors or activators, or amyloid beta protein inhibitors of the TAKI polypeptide function, particularly kinase activity. The present sequence represents human TABI.

 This protein comprises human TAB1, a novel member of the transforming growth factor-beta receptor signal transduction pathway, which activates TAK-1 kinase activity upon binding. Its pathway, which activates TAK-1 kinase activity upon binding. Obtained from a cid sequence was deduced from a cDNA clone (see AAT31176) obtained from a kidney library; a variant TAB1 (see AAW26706) has ser rather than Arg at amino acid position 52. Also claimed are: isolated DNA encoding a protein modified by a substitution, deletion and/or addition of 1 or more amino acids of the 504-residue TAB1 sequence; (2) DNA which can hybridise with the 1560 by TAB1 nucleic acid sequence; (3) isolated DNA encoding a protein comprising an above protein or polypepide; (5) expression vector comprising an above protein or polypepide; (5) expression vector comprising an above DNA; and (6) host cell, preferably a mammalian or yeast cell, transformed by the expression vector. Cells expressing TAB1 and TAK1 can be used to screen for TGF-beta signalling pathway inhibitors by contacting the cells with a test compound, and measuring the TAK1 kinase

 AAP15566 to AAP16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens antigens, given in AAB56363 to AAB57302. The prostate cancer antigens anhave neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive.

 The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and Br 474 cells. The method involves contracting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater capture to probe for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid

 The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.

(SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
 cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
 The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
 Peptide #809 encoded by probe for measuring placental gene expression.

Clone distribution: MGC clone distribution information can be for through the I.M.A.G.E. Consortium/Libla at: http://image.llnl.gov Series: IRAK Plate: 45 Row: k Column: 11
This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis, GenomeScan gene prediction.

 This sequence was generated from part of bacterial clone contigs of human chromosome 22, constructed by the Sanger Centre Chromosome 22 human chromosome 22, constructed by the Sanger Centre Chromosome 22 http://www.sanger.ac.uk/HGP/Chr22

During Sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw., SWISSENCY; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at the known sanger ac.uk/Projects/Celegans/wormpop RP3-407F17 is from the library RPCI-3 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong. For further details see http://www.sanger.ac.uk/projects/Celegans/wormpop RP3-407F17 is Institute by the group of Pieter de Jong. For further details see http://pecpac.med.buffalo.edu/
 IMPORTANT: This sequence is not the entire insert of clone RR93-407F17 It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

The true left end of clone RR93-407F17 is at 1 in this sequence. The true left end of clone RR93-407F17 is at 69561 in this sequence. The true right end of clone RR93-333H23 is at 17123 in this sequence.
 HS407F17 1999 DNA linear PRI 12-DEC-1999 Human DNA sequence from clone RP3-407F17 on chromosome 22 Contains the gene for TAR1 (TAK1 binding protein 1), ESTs, STSs, GSSs and two putative CpG islands, complete sequence.
 Submitted (08-DEC-1999) Sanger Centre, Hinxton, Cambridgeshire, Submitted (08-DEC-1999) Sanger Centre, Hinxton, Cambridgeshire, CBIO 18A, UK. E-mail enquirities: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
On Jul 10, 1999 this sequence version replaced gi:5419637.
This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
 Eukaryoča; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 59 contigs. The true order of the pieces is not known and their order in this sequence record is
 arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

```
NOTE: This is a 'working draft' sequence. It currently consists of 59 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 This sequence encodes the human TAB1 protein.
The invention relates to a method for screening a substance inhibiting the formation of a complex between XIAP and TAB1, in which X-linked inhibitor of apoptosis protein (XIAP), transforming growth factor-beta activated kinase 1(TAK1) binding protein 1(TAB1) and a substance to be tested are contacted with each other and then the presence or formation of a complex between XIAP and TAB1 is detected. The substance can be used as a drug for extracellular matrix protein production enhancement, cell growth inhibition, monocyte migration, physiologically active substance induction, immunosuppression, and beta-amyloid protein deposition. A substance inhibiting the formation of a complex between TAB1 and XIAP as well as between XIAP and TGF-beta (Transforming growth factor-beta) type I and/or type II receptor is useful as a drug.

 This cDNA clone codes for human TAB1 (see AAW26706), a novel member of the transforming growth factor-beta receptor signal transduction pathway, which activates TAK-1 kinase activity upon binding. To obtain the full-length TAB1 coding sequence, a human kidney cDNA library was screened using as a probe a partial TAB1 cDNA obtained from a yeast two-hybrid assay for proteins that interacted with TAB1. The 5' terminus was identified by 5'RACE. 2 Different clones were sequenced, with cytosine and adenine (see AAT91178) as the 18ERA nucleotide, respectively, and deposited as FERM BP-5599 and FERM BP-5509. respectively. Also claimed are: isolated DNA encoding a protein modified by a substitution, deletion and/or encing a protein modified by a substitution, deletion and/or addition of 1 or more amino acids of the 504 residue TAB1 sequence; (2) bnA which can hybridise with the 1560 bp nucleic acid sequence; (3) isolated DNA encoding a protein comprising an above protein or polypeptide; (5) expression vector comprising an above DNA, and (6) host cell, preferably a mammalian or yeast cell, transformed by the expression vector. Cells expressing TAB1 and TAR1 can be used to screen for TGF-beta signalling pathway inhibitors by contacting the cells with a test compound, and measuring the TAR1 kinase activity.
 /note= "another clone has adenine at position 185,
with codon AGC (Ser) altered to AGA (Arg)"
 DNA encoding TAK1 binding protein TAB1 - member of transforming growth factor beta receptor signal production pathway, which activates TAK-1 kinase activity upon binding

Screening drugs for for TGF- beta inhibitory substances, which are treatment of diseases relating to its disorder useful

Example 1; Page 143-147; 195pp; Japanese.

A method has been developed for screening for substances which inhibit the binding of TAKI polypeptide to TABI polypeptide. The method comprises: (a) contacting the polypeptide in the presence of a sample, and (b) detecting the mount of bound polypeptide, in which the sample can be pre-mixed with TAKI or TABI polypeptide first. The transforming growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or cell proliferation prevention inhibitors of activators, or monocyte migration inhibitors or activators, or monocyte migration inhibitors or activators, or monocyte migration inhibitors or activators, or monocyte migration inhibitors or activators, or monocyte migration inhibitors or activators, or physiological activity induction inhibitors or activators, or immunosuppression inhibitors or activators, or amyloid beta protein precipitation inhibitors or activators, and such substances can also inhibitors of the TAKI polypeptide function, particularly kinase activity. The present sequence encodes human TAB1. which the sample The transforming used in drugs for õ

The present invention describes a method for screening compounds for inhibition of inflammatory cytokine signal transduction by contacting the sample with TAK1 and its receptor TAB1 and selecting for inhibition of TAK1 Data its selecting for inhibition of inflammatory cytokine signal transduction in which the inhibition of TAK1 phosphorylation is selected for; and drug compositions for the treatment of inflammatory disorders containing as active component an inflammatory cytokine signal transduction inhibitor. TAK1 is an essential component of the signalling process which results in release of inflammatory cytokines such as interleukin-1 (IL-1), IL-10, tumour necrosis factor (TAF) and IL-6. The methods can be used for the selection of effective antiinflammatory agents. The present

 CC the binding of TAK1 polypeptide to TAB1 polypeptide. The method controlled to the controlled to the polypeptide in the presence of a sample; comprises: (a) contacting the polypeptide in the presence of a sample; cand (b) detecting the amount of bound polypeptide, in which the sample can be pre-mixed with TAK1 or TAB1 polypeptide first. The transforming cran be pre-mixed with TAK1 or TAB1 polypeptide first. The transforming cranticitions or gravity and transmission inhibitors or cidications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement crantibitors or activators, or cell proliferation prevention inhibitors or activators, or activators, or monocyte migration inhibitors or activators, or composite migration inhibitors or activators, or contibitors or activators, or activators, or activators of the TAK1 polypeptide function, particularly kinase crivity. The present sequence encodes human TAB1.
 Screening for TGF- beta inhibitory substances, which are useful drugs for treatment of diseases relating to its disorder {\sf d}

This cDNA clone codes for human TAB1 (see AAW26707), a novel member of the transforming growth factor-beta receptor signal transduction bethe transforming growth factor-beta receptor signal transduction obtain the full-length TAB1 coding sequence, a human kidney cDNA library was screened using as a probe a partial TAB1 cDNA obtained from a yeast two-hybrid assay for proteins that interacted with TAM1. The 5' terminus was identified by 5'RACE. 2 Different clones were sequenced, with cytosine (see AAT91175) and adenine as the 185th nucleotide, respectively, and deposited as FERM BP-5599 and FERM BP-569, respectively. Also claimed are: isolated DNA encoding a protein modified by a substitution, deletion and/or addition of 1 or more amino acids of the 504-residue TAB1 sequence; (2) DNA which can hybridise with the 1560 by nucleic acid sequence; (3) isolated DNA encoding a protein comprising an above protein or polypeptie; (5) expression vector comprising an above protein or polypeptie; (5) expression comprising TAB1 and TAM1 can be used to screen for TGF-beta contrains that we have the contrains
 "another clone has cytosine at position 185, with codon AGA (Arg) altered to AGC (Ser)"
 signalling pathway inhibitors by contacting the cells with a test

 The invention relates to novel genes (ABAll004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone
 Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system

(b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis, (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections.
 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

```
The invention relates to novel genes (AA134669-AA137666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrend gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, "..."
 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
 (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and
 Isolated polypeptide for treating, preventing and/ or prognosing disorders related to the musculoskeletal system including musculoskeletal cancers and also for testing and detection e.g.
 Example 2; SEQ ID NO 3349; 781pp + Sequence Listing; English.

 proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. AAF16506 to AAF16514 to AAB57303 represent sequences used in the exemplification of the present

 cc nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting cthe probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label cound to each probe of the microarray. The probes are useful for coverifying the expression of regions of genomic DNA predicted to cencode proteins. They are useful for gene discovery, and for cencode proteins. They are useful for gene discovery, and for cexpression analysis is useful for assessing breast disease. Gene cagents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence as a single exon nucleic acid probe of the invention. So that the sprinted specification, but was obtained in electronic format directly from the property of the sequence is a single exon mucleic acid probe of the invention.

 The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the
